Class Credit

- ▶ CIL developed and taught until 2014 by Joachim Buhmann and various research associatesassistants
- ▶ Ongoing changes, amendments, new lectures by Thomas Hofmann & Co. since 2015
- ▶ Projects by Aurelien Lucchi, Thomas Hofmann & Co.

Weekly Schedule: 2 + 2 + 1

- ▶ **Lecture:** Fri 10-12, ML D 28
- ▶ **Exercises:** Thu 15-17, CAB G51 **or** Thu 16-18, CAB G61 **or** Fri 15-17, CAB G61
 - ▶ all three exercise sessions are "identical"
 - ▶ first hour: pen-and-paper **exercise**, immediate discussions
 - ▶ second hour: group work on programming **assignment**
 - ▶ may need to "load balance", if distribution is skewed
- ▶ Voluntary presence time: Mo 11-12, CAB H53
 - ▶ TAs help completing programming assignments
- ▶ **Webpage:** <http://cil.inf.ethz.ch>
 - ▶ only accessible from the ETH network or VPN

Recording & Slides

- ▶ **Lecture slides** are (generally) posted before class
- ▶ Lectures are automatically **recorded** (voice + screen)
- ▶ Heavy use of **blackboard** (!) – not recorded (ETH limitation)
- ▶ Photos of board content posted after class – on a best effort basis
- ▶ *it is recommended that you come to class*

Digital Interactions

- ▶ Q&A platform – piazza.com
 - ▶ please sign up for an account
- ▶ ETH Edu App – used for classroom interaction
 - ▶ please download in app store
 - ▶ see [ETH documentation](#)
 - ▶ use nethz login – questions automatically pushed to you

Programming Project

- ▶ Joint work in groups of **two or three** students
- ▶ Solving problems by applying techniques learned in class
- ▶ Submitting solution to the CIL online evaluation & ranking system

Been here before? :-/

- ▶ You can re-submit previous year's project.
- ▶ You have to let us know that you are a "one person group"
- ▶ You have the choice to redo the project and join a group (as anyone else)

First Week

Coming week: exercise session on **Python** programming.

- ▶ Bring laptops with Python installed
- ▶ “Hands on” exercises in groups of 2-3 students

Reading material

- ▶ Linear algebra background – on the course website

Grading Criteria

Written Exam

- ▶ 120 minutes written exam, closed book (2x A4-pages of notes)
- ▶ Problems in the spirit of the pen-and-paper exercises

Semester Work

- ▶ Develop a **novel solution** for one of the application problems
- ▶ **Compare** with two baseline techniques already implemented in the weekly programming assignments
- ▶ Write up in the form of a short **paper**
- ▶ Competitive criteria: run-time, accuracy, ..
- ▶ Non-competitive criteria: paper review, creativity of solution, quality of implementation

Grading Formula

- ▶ **Final examination** – during examination period
- ▶ Project work in small teams – highly recommended
- ▶ Grading
 - ▶ $\text{exam} < 3.5$: \implies fail
 - ▶ $\text{exam} \geq 3.5$:

$$\text{grade} = \frac{2}{3} \text{ exam grade} + \frac{1}{3} \max \left\{ \text{exam grade}, \underbrace{\text{project grade}}_{\text{potential uplift}} \right\}$$

Section 2

Goals & Content

Learning Goals

- ▶ Acquire and deepen fundamental concepts of machine learning
- ▶ Focus on: matrix factorization and representation learning
- ▶ Implement and compare techniques and models
- ▶ Goal:
 - ▶ understand and analyse methods
 - ▶ find best solutions to practical problems
- ▶ Expected background:
 - ▶ basic class on machine learning (e.g. LIS@ETHZ)
 - ▶ mathematics: linear algebra, vector analysis, prob & stats
 - ▶ programming: Python (easy to learn)

Matrix Factorization

Core problem: **matrix factorization** (MF) of a data matrix into factors, e.g.

$$\begin{array}{c|c} \mathbf{X} & \approx \\ \hline m \times n & \end{array} \quad \begin{array}{c|c} \mathbf{A} & \cdot \\ \hline m \times k & \end{array} \quad \begin{array}{c|c} \mathbf{B} & \\ \hline k \times n & \end{array}$$

Many important data analysis techniques can be written as MF problems by specifying ...

- ▶ **Type of data:** e.g. Boolean: $x_{ij} \in \{0, 1\}$ or non-negative: $x_{ij} \in \mathbb{R}_{\geq 0}$
- ▶ **Approximation:** e.g. exact: $\mathbf{X} = \mathbf{A} \cdot \mathbf{B}$ or minimal Frobenius norm: $\min_{\mathbf{A}, \mathbf{B}} \|\mathbf{X} - \mathbf{A} \cdot \mathbf{B}\|_F$
- ▶ **Constraints on factors:** e.g. \mathbf{A} has to be a basis or \mathbf{B} must be sparse.

Learning Representations

More broadly: study methods of **learning data representations**

- ▶ Dimension reduction
- ▶ Latent variable models
- ▶ Data clustering
- ▶ Sparse coding
- ▶ Deep neural networks
- ▶ Generative models

Section 3

Projects

Project Overview

- ▶ Real world data sets and challenges – you pick one!

1

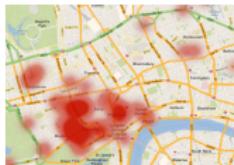

preferences
recommender

2

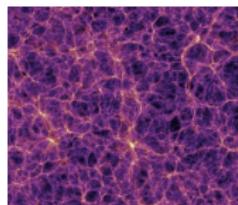

texts & tweets
sentiment

3

aerial imagery
segmentation

4

cosmology
galaxies

- ▶ Combine and extend techniques ⇒ **novel solution**
 - ▶ compare to baselines developed during the course
- ▶ Produce a write up of your findings ⇒ **scientific short paper**
 - ▶ emphasize experimental protocol, metrics, and reproducability

Project 1: Collaborative Filtering

Recommender system: present items of likely interest to a user

- ▶ Products: Amazon
- ▶ Movies: Netflix, IMDB
- ▶ Music: LastFM, Spotify

Collaborative filtering (CF) makes recommendations based on:

- ▶ (known) preference of a user towards other items
- ▶ collective preferences of other users

Project 1: Collaborative Filtering

Viewers were asked to rate some movies (items):

| | Ben | Tom | John | Fred | Jack |
|---------------|-----|-----|------|------|------|
| Star Wars | ? | ? | 1 | ? | 4 |
| WallE | 5 | ? | 3 | 4 | ? |
| Avatar | 3 | 4 | ? | 4 | 4 |
| Trainspotting | ? | 1 | 5 | ? | ? |
| Shrek | 5 | ? | ? | 5 | ? |
| Ice Age | 5 | ? | 4 | ? | 1 |

- ▶ Not all viewers rated all movies.
- ▶ We want to predict unrated user-movie pairs (**matrix completion**)
- ▶ Should we recommend Fred to watch “Ice Age” ?

Project 2: Sentiment Classification

Automatic sentiment analysis to give a machine the ability to understand text and its polarity.

- ▶ **Data:** we provide a large set of training tweets.

- ▶ **Ground-truth:** each tweet is labeled as {negative, positive}.

- ▶ **Goal:** train classifier using word vectors to predict polarity

Positive: "i have the worlds best dad"

Negative: "pouring rain outside . wish i could go out"

Project 3: Semantic Segmentation

Extract roads from satellite images

- ▶ **Data:** set of satellite/aerial images acquired from GoogleMaps
- ▶ **Ground-truth:** images with pixels labeled as {road, background}.
- ▶ **Goal:** train a classifier to segment roads in these images, i.e. assign a label {road=1, background=0} to each pixel.

Project 4: Galaxy Image Generation

- ▶ **Data:** astronomical images acquired from wide field imaging surveys.
- ▶ **Ground-truth:** pixels labeled as {background, star, galaxy}
- ▶ **Goal:** train a generative model that can generate galaxy images.
